

I am

A system is formed to predict the farmland with the help of sensors, humidity, soil moisture etc

I'm trying to

It increase production, remote monitoring, lowered operation cost, water conservation

But

Poor internet connectivity in farms, lack of infrastructure

Because

It improves the entire agriculture system by monitoring the field in real-time.

Which makes me feel

Main aim of our project is to protect the crops from damage cost by animals as well as divert the animal without any harm.
